PROFILE

I'm a product-minded engineering lead with 25 years of experience taking software from a vague idea to a product people genuinely enjoy using. I'm at my best owning the whole picture: talking to users, deciding what's worth building, shaping the UX together with design, making the architectural decisions, mentoring the team, and still writing the difficult code myself.

I care deeply about user experience, clean architecture, code quality, and long-term maintainability, and I value pragmatic solutions over unnecessary complexity. The tools matter less than the judgment: I work most in Python, TypeScript, and Swift, but what I really bring is the ability to make good product and technical decisions across the whole stack.

I've been online since 1994, creating websites since 2000 and iOS apps since 2010. My portfolio and open source projects can be found at www.loopwerk.io.

INTERESTS

- Games, movies and TV shows
- Tabletop roleplaying games
- Music
- Photography
- Architecture, art and art history
- Traveling
- Writing

SKILLS

- Product and leadership: product strategy and prioritization, UX and design collaboration, technical leadership, mentoring, end-to-end ownership
- Architecture: system and API design, data modeling, testing strategy, refactoring and modernizing legacy codebases
- Languages: Python, TypeScript / JavaScript, Swift
- Web: Django, Django REST Framework, SvelteKit, htmx, Alpine.js, Tailwind, HTML/CSS
- Mobile: SwiftUI, UIKit, Objective-C
- Infrastructure: PostgreSQL, Nginx, Debian/Ubuntu, Coolify, GitHub Actions

LANGUAGES

- Dutch (mother tongue)
- English (fluent)
- German (beginner)

EXPERIENCE

Product & Engineering Lead, Loopwerk, 100% remote

September 2016 - present

I take products from idea to shipped software for international clients: shaping what to build, designing the UX, making the architectural decisions, and building the hard parts myself. My goal is always clean, straightforward code that solves complex problems and still makes sense a year later. I work mainly in TypeScript, Python, and Swift.

Selected projects (full list at www.loopwerk.io/work/):

Sound Radix (TypeScript, Python)

Took over end-to-end development of soundradix.com (SvelteKit) and its Django backend. Rewrote the frontend from JavaScript to TypeScript and added comprehensive test coverage, making future work far safer. Replaced the entire Django Oscar webshop with a custom-built system, unlocking features that were previously impossible, significantly improving performance, and measurably increasing yearly revenue. Redesigning the shop administration and reporting tools, making sales insights more accessible and cutting operational overhead.

WeTransfer (Swift)

Helped refactor the iOS app to a single MVVM-C architecture, replacing the mix of inconsistent architectures different teams had built over the years. This unified foundation simplified future development and let the team move faster without breaking things.

Critical Notes (TypeScript, Python)

Designed, built, and run my own SaaS: a note-taking tool for tabletop role-playing games, with Stripe subscriptions, built on SvelteKit and Django REST Framework. I own every decision, from pricing and onboarding to architecture and support.

Sentry (Objective-C)

Built the very first version of Sentry's iOS SDK in 2012. Returned in 2022 to work on the second-generation SDK, contributing 100+ pull requests including out-of-memory crash reporting. I remain one of the top contributors.

Skippit (Swift)

Built the entire app for the first dating product with in-app video calls after matching, including the Tinder-style swiping interface and the video calling.

Unilever (Swift)

Worked on Tessa, an app where people scan grocery receipts to earn points on Unilever products. I was the main driver behind the app's architectural improvements, including a move to MVVM-C.

Last.fm scrobbler (Objective-C, Swift)

Built and maintained the two official Last.fm scrobbler apps for iOS and iPadOS, including a full Swift rewrite of the original. Last.fm is my oldest client; recent work brought detailed listening reports into the app.

Lead developer, Gangverk, Reykjavik

January 2012 - August 2016 (4 years 8 months)

Built iOS apps and Python backends for CBS Interactive and its brands (Radio.com, Last.fm, MetroLyrics, Tailgate Fan, Live on Letterman) and Icelandic clients like Síminn. Led small teams on several iOS projects, and started and maintained multiple open source projects. From 2014 I was the lead web developer on Sling, Gangverk's scheduling and communication tool for non-desk workers, and also contributed to its native iOS app.

Senior Python developer, Getlogic, Groningen

June 2011 - December 2011 (7 months)

Python / iOS developer, Goldmund, Wyldebeast & Wunderliebe, Groningen

September 2009 - May 2011 (1 year 9 months)

PHP developer, DMM Websolutions, Groningen

March 2005 - August 2009 (4 years 6 months)

Freelance PHP developer, Dualdot, Groningen

June 2004 - December 2006 (2 years 7 months)

Junior PHP developer, University of Groningen

April 2001 - March 2003 (2 years)

VOLUNTEERING

Mentor for junior developers

January 2021 - December 2025

Ran a free one-on-one mentorship program using video calls, screen sharing, and pair programming to help underprivileged people grow as developers. Started with iOS, then shifted to web development with Python and TypeScript in 2023.
